

Agent AURA

Agent AURA — AI for Understanding, Reference & Action

Team Research & Automation Blueprint — Tata Steel

1. Current Problems Faced by the Team

From Sneha:

- Content is generated manually every day using ChatGPT/Gemini — no saved workflow.
- Full prompt has to be typed from scratch every time — very time-consuming.
- Poster characters, mascots, and layout change randomly because there is no fixed template in the prompt.
- ChatGPT/AI image generation has a daily limit — team hits the cap and gets stuck.
- After poster is made, it is sent to Ma'am for review. Ma'am posts it manually on the platform at 3 PM.
- Poll/question is also posted manually at 11 AM next day — same manual process.

From Ayush:

- Content is too generic — AI doesn't understand Tata Steel's specific audience without detailed prompting.
- Team has to go back and forth with multiple prompts to refine the post — no fixed system.
- 3 people working on this but no shared workflow or automation — everyone doing it manually.
- Ma'am is the final gatekeeper — she approves and posts everything herself.

2. Current End-to-End Process (How It Works For Now)

Step	What Happens
Step 1 — Topic	Ma'am gives a weekly topic/theme to the team
Step 2 — Content	Team uses ChatGPT or Gemini to generate day-wise AI content based on the topic
Step 3 — Poster	Content is used as a prompt to generate poster image in ChatGPT
Step 4 — Edits	If anything looks wrong (mascot, colors, layout), team prompts again to fix it manually
Step 5 — Approval	Final poster is sent to Ma'am for review and approval
Step 6 — Post at 3 PM	Ma'am posts the approved poster on the AURA web platform at 3:00 PM IST
Step 7 — Poll at 11 AM	Next day at 11:00 AM, a related question/poll is manually posted on the platform

3. Solutions to Work On (Automation Plan)

Based on the team's pain points, here is what Agent AURA should automate:

- Auto-generate day-wise content from a weekly topic using a fixed, saved prompt template — no need to retype every day.
- Auto-generate poster using a consistent branded template (fixed layout, mascot, Tata Steel colors) — no random changes.
- Schedule automatic posting on the web platform at 3:00 PM IST daily.
- Auto-generate and schedule the next-day poll/question at 11:00 AM IST based on the previous day's content.
- Build a review/approval step so Ma'am can approve with one click before it goes live — instead of manual posting.
- Use a content calendar (Excel/Sheet) where topics are pre-planned — agent picks the topic automatically.

4. Questions We Still Need Answered

The following questions are critical to build the automation. These need to be answered by the tech team:

#	Question	Why It Matters
1	Does the AURA web platform have an API to post content programmatically?	<i>Without API, automation cannot post to the platform</i>
2	What authentication is needed to post — API key, login, or OAuth?	<i>Agent needs credentials to connect</i>
3	What is the backend tech stack — Python, Node.js, .NET?	<i>Determines what language to build the agent in</i>
4	Is there an admin panel to post? Can we access it via code?	<i>If no API, we may automate via the admin panel</i>
5	Where will the weekly topic calendar be maintained — Excel, Google Sheet, or SharePoint?	<i>Agent will pick topics from here automatically</i>
6	Is Azure OpenAI or any LLM API approved for use within Tata Steel?	<i>Agent needs an AI model to generate content</i>
7	Is there a fixed Tata Steel poster template — logo, colors, mascot, layout?	<i>Needed for consistent poster generation every day</i>
8	What cloud/server is available — Azure, AWS, or on-premise?	<i>Agent will be hosted and scheduled here</i>
9	Should posts go live automatically or does Ma'am need to approve first?	<i>Determines if we add an approval step</i>
10	Is there a way to post polls/questions on the platform via API or admin panel?	<i>Needed to automate the 11 AM question posting</i>
